## Naïve Bayes Classifier

Il-Chul Moon
Dept. of Industrial and Systems Engineering
KAIST

icmoon@kaist.ac.kr

#### Weekly Objectives

- Learn the optimal classification concept
  - Know the optimal predictor
  - Know the concept of Bayes risk
  - Know the concept of decision boundary
- Learn the naïve Bayes classifier
  - Understand the classifier
  - Understand the Bayesian version of linear classifier
  - Understand the conditional independence
  - Understand the naïve assumption
- Apply the naïve Bayes classifier to a case study of a text mining
  - Learn the bag-of-words concepts
  - How to apply the classifier to document classifications

# OPTIMAL CLASSIFICATION AND DECISION BOUNDARY

## Supervised Learning

- You know the true value, and you can provide examples of the true value.
- Cases, such as
  - Spam filtering
  - Automatic grading
  - Automatic categorization
- Classification or Regression of
  - Hit or Miss: Something has either disease or not.
  - Ranking: Someone received either A+, B, C, or F.
  - Types: An article is either positive or negative.
  - Value prediction: The price of this artifact is X.
- Methodologies
  - Classification: estimating a discrete dependent value from observations
  - Regression: estimating a (continuous) dependent value from observations

#### Supervised Learning

**You** know the true answers of some of instances

#### **Optimal Classification**

- Optimal predictor of Bayes classifier
  - $f^* = argmin_f P(f(X) \neq Y) \Rightarrow f$  | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f | f
  - Function approximation of error minimization
- Assuming only two classes of Y

• 
$$f^*(x) = argmax_{Y=y}P(Y=y|X=x)$$

$$\sum_{y \in Y} P(Y = y | X = x) = ?$$

#### Detour: Thumbtack MLE and MAP

- Your response was
  - Previously in MLE, we found  $\theta$  from  $\hat{\theta} = argmax_{\theta}P(D|\theta)$

• 
$$P(D|\theta) = \theta^{a_H}(1-\theta)^{a_T}$$

• 
$$\hat{\theta} = \frac{a_H}{a_H + a_T}$$

• Now in MAP, we find  $\theta$  from  $\hat{\theta} = argmax_{\theta}P(\theta|D)$ 

• 
$$P(\theta|D) \propto \theta^{a_H + \alpha - 1} (1 - \theta)^{a_T + \beta - 1}$$

$$\hat{\theta} = \frac{a_H + \alpha - 1}{a_H + \alpha + a_T + \beta - 2}$$

- The calculation is same because anyhow it is the maximization
- Assume
  - Y={H,T}, then  $\theta$  is a probability value to see the head
  - X=D, previous trials, dataset

• 
$$\hat{\theta} = argmax_{\theta}P(\theta|D)$$

$$\rightarrow f^*(x) = argmax_{Y=y}P(Y=y|X)$$

**User assumes** 

 $\widehat{\boldsymbol{\theta}} > 0.5$  then Y=H

Classifier tells
Y=H or not

#### Optimal Classification and Bayes Risk

- Optimal classifier will make mistakes,  $R(f^*) > 0$
- Why?
  - Not enough information of the joint probability

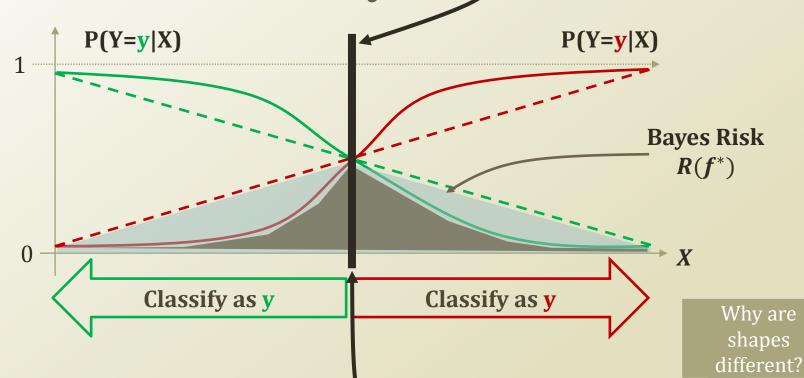

• 
$$P(Y = y | X = x) = \frac{P(X = x | Y = y)P(Y = y)}{P(X = x)}$$

•  $f^*(x) = argmax_{Y=y}P(Y = y|X = x) = argmax_{Y=y}P(X = x|Y = y)P(Y = y)$ 

Class Conditional Density

Class Prior

Decision Boundary

•  $f^*(x) = argmax_{Y=y}P(Y=y|X=x)$  $= argmax_{Y=y}P(X = x|Y = y)P(Y = y)$ 

What-if Gaussian class conditional density?

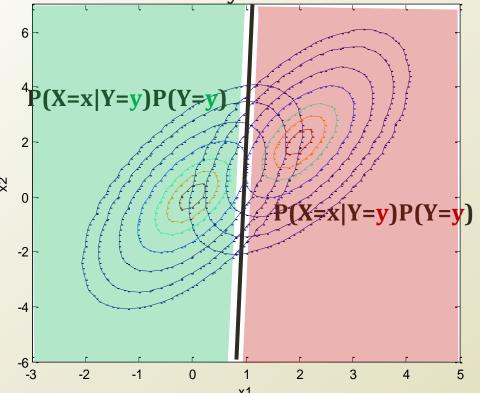

•  $P(X = x; \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$ 

P(X=x|Y=y)P(Y=y)

P(X=x|Y=y)P(Y=y)

#### Decision Boundary in Two Dimension

$$P(X = x; \mu, \sigma) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right)$$

$$f^*(x) = argmax_{Y=y}P(Y = y|X = x)$$
  
=  $argmax_{Y=y}P(X = x|Y = y)P(Y = y)$ 

- Two multivariate normal distribution for the class conditional densities
- Decision boundary
  - A linear line
- Linear decision boundary
- Any problem in the real world applications?
  - Observing the combination of x<sub>1</sub> and x<sub>2</sub>

$$P(X = (x_1, x_2)|Y = y) = \frac{1}{\sqrt{2\pi|\Sigma_y|}} \exp(-\frac{(x - \mu_y)\Sigma_y^{-1}(x - \mu_y)'}{2})$$

#### Learning the Optimal Classifier

- Optimal classifier
  - $f^*(x) = argmax_{Y=y}P(Y = y|X = x)$ =  $argmax_{Y=y}P(X = x|Y = y)P(Y = y)$

**Class Conditional Density** Class Prior

- Need to know
  - Prior = Class Prior = P(Y = y)
  - Likelihood = Class Conditional Density = P(X = x | Y = y)
- How to know the values?
  - Through observations from the dataset, D
  - Then, does D has all X and Y?
    - Particularly, X in all combinations?
